SCIENTIFIC ACHIEVEMENTS

Piero Del Boccio Ph.D is Associated Professor SSD BIO/10, from 01/10/2015, Department of Pharmacy, "G. d'Annunzio" University Chieti, Italy. He started his research experience in 1999 within the research group of Prof De Angelis (L'Aquila University, Italy) studying enzyme activity in surfactant media through mass spectrometry technologies. After his master degree (with the mark of 110/110 cum laude) in Environmental Sciences (2001) he moved to Santa Maria Imbaro (Chieti, Italy) at the “Mario Negri Sud” Pharmacological Research Institute (2001-2003) where he has been working on the development of analytical methods for the study of natural compounds of pharmacological interest both in natural and biological matrices using Liquid Chromatography-Tandem Mass Spectrometry (LC-MS/MS). Following this experience, he moved to Chieti University at the Biomedical Sciences Department, for a PhD program. During the PhD training he has been working in the Analytical Biochemistry and Proteomics Unit at the Ce.S.I., Centre of Study on Aging. His scientific experience has been mostly focused in the identification and characterization of metabolic and protein alteration in different area of Biomedical Research (mainly neurodegenerative disorders) by proteomics and metabolomics approach.

He published many milestone papers on samples handling for proteomics study, by highlighting important ex-vivo alteration in sera and Cerebrospinal fluid (CSF) of patients affected by Multiple Sclerosis (MS). During this period many studies aimed to characterize molecular alterations in the neurodegenerative diseases are published; papers in which he characterizes specific post-translational modifications of proteins and altered lipidomics profiling in CSF of MS subjects. In the last years His research was focuses on tears, considered a window on the nervous system, demonstrating that the Extracellular Vesicles (EVs) can represent the shuttles able to allow the cross-talk between CSF and tears, demonstrating that EVs from CSF and tears carrying very similar protein cargo. Those results were obtained thanks to a new developed protocol in collaboration with other resident groups at the CAST center, consisting in an optimized proteomics approach for the study of FACS-sorted EVs from untouched biological samples. Such a new strategy for the molecular study of EVs can be employed in a wide range of biomedical issues.
